No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                      Submitted (12-MAR-1997) Human Genome Center, University of Washington, Box 352145, Seattle, WA 98195, USA
This entry has been annotated with sequence quality estimates computed by the Phirap assembly program. These values are not generally visible from the Genbank flat file format but are available as part of the ASN.1 file.

Verification: This sequence has been verified by Multiple Complete Digest Mapping. Comparison of the experimentally derived map digest fragments with sequence-predicted fragments is given below. Small fragments below a variable cutoff (approximately 400-600bp) are not mapped and hence do not appear in the table. There are no significant remaining descrepancies between the experimental and predicted values. Uniquely ordered fragment groups are separated by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     18;

* NOTE: This is a 'working draft' sequence. It currently

* consists of I contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

                                                                                                                                   This sequence is of BAC TIF15 from Arabidopsis thaliana chromosome 1. The sequence does not represent the sequence of the entire insert of this clone. It is shorter by 11342 bp because we submit only the unique sequence of the clone. However, in order to facilitate the joining of overlapping clones in the future for creation of larger contigs, we provide a small overlap (200 bp) between overlapping submitted clones. The 3' end of this sequence overlaps by 200 bp the 5' end of the sequence of the BAC FIN21.
                                                                                                                                                                                                                                                                                                                                                                               Vysotskaia, V.S., Schwartz, J.R., Toriumi, M., Yu, G., Oji, O., Kwan, A., Liu, S., Li, J., Araujo, R., Au, M., Berendel, V., Buehler, Conway, A.B., Conway, A.B., Conway, A.B., Conway, A.B., Conway, A.B., Conway, A.B., Coway, A

E-mail enquires: humquery@sanger.ac.uk Clone requests: Clonerequest@sanger.ac.uk On Jun 3, 1999 this sequence version replaced gi:4837662.

IMPORTANT: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector, phage etc. Order of segments is not known; 800 n's separate segments. Unfinished: dJI018D12 Contig_ID: 01259 acc=AL031650 Length: 142349 bp Unfinished: dJ1018D12 Contig_ID: 03240 acc=AL031650 Length: 1365 bp.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are c sequenced and submitted once, so the sequence for the remainder the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Submitted (29-MAY-1999) Human Genome Sequencing Center, De of Molecular and Human Genetics, Baylor College of Medicin Baylor Plaza, Houston, TX 77030, USA On May 29, 1999 this sequence version replaced gi:4895152. COMMENT

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing. gc-help@bcm.tmc.edu

ANNOTATION OF FEATURES:

STSS are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and CDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE: Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation

The high affinity receptor is a tetrameric complex consisting of 2 gamma subunits and one each of subunits alpha and beta. It is expressed on mast cells and is involved in the allergic response. COS-7 cells cotransfected with cDNA for all 3 intact subunit types (derived from rat basophilic leukaemia cells) express receptor on their surfaces. Detailed study of the receptors is now possible. Human high affinity IgE receptor alpha subunit
Allergic response; antagonist; drug screening;
reaction; diagnosis; therapy; FCERI; ss.
Novel DNA encoding alpha sub-unit of human high affinity IgE receptor - useful as antagonist to prevent allergic response, reagent in drug screening and for antibody generation Disclosure; Fig 1; 34pp; English.

The sequence is that of the gene encoding the human IgE high receptor alpha subunit (FCERI). It may be used to synthesise human FCERI alpha subunit or to synthesise cDNA sequences to construct DNA probes useful in diagnostic assays.

Sequence 1150 BP; 373 A; 237 C; 227 G; 310 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA coding alpha, beta and gamma-units of IgE high affinity receptor - are used to prepare recombinant polypeptide(s) for treating allergy, drug screening or monitoring IgE level.

Disclosure; Fig 1: 58pp; English.

A lambda gtl1 library was prepared from poly-A RNA isolated fr KUB12 cells. Screening was by a cDNA fragment from the rat Fc(epsilon)RI alpha cDNA corresponding to nucleotides 119-781.

Positive Clones were subcloned and sequenced.

The sequence is that of the human FCRI alpha subunit, isolated by using first strand reverse transcriptase from human basophils by the gene and its prod. can be used to identify human beta subuit FCRI inhibitors (immunoglobulin E receptor) which inhibit the binding of IgE to its receptor and inhibit the aggragation functiof the receptor or the signal transducing function related to allergic response. Such inhibitors can be used for the treatment prevention of allergic disease.

                                                                                                                                                                                                                                                                                                                                                                                             Helicobacter pylori CP2 antigen structural polypeptide(s) - also corresponding DNA, useful as reagents for detecting H. pylori and in the production of vaccines Claim 3; Page 16-18; 29pp; English.

A structural gene (T45041) of Helicobacter pylori ATCC 43504 codes for the CP2 antigen (W06481) useful in vaccine produ. Genomic for the CP2 antigen (W06481) useful in vaccine produ. Genomic fragments of H. pylori DNA were inserted into vector pBluescript, and E. coli JM109 transformants were screened using a probe based on the N-terminal sequence of CP2. PCR primers (T45048-49) based on the N-terminal sequence of CP2. PCR primers (T45048-49) based on isolated clones were then used to amplify the structural gene. The gene sequence differs slightly from those of CP2 genes (see also T45042 and T45043) obtd. by PCR amplification. CP2 genes can be used to produce recombinant CP2 in transformed host cells, or to design primers (see also T45044-47) useful in the specific detection of H. pylori.

Helicobacter pylori CP2 antigen structural polypeptide(s) - also corresponding DNA, useful as reagents for detecting H. pylori are the production of vaccines Claim 3; Page 21-23; 29pp; English.

A structural gene (T45043), designated CP2-PCR2, codes for the Cantigen (W06483) of a clinical isolate of Helicobacter pylori obtains a patient with chronic gastritis. It was produced by PCR amplification using primers (see also T45048-49) based on the CP2-PCR2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1386

                                                                                                                                                                                                  and screening assays
Claim 1; Fig 1A-B; 15pp; English.
This cDNA sequence encodes the alpha subunit of the human high affinity
receptor for IgE (FCERI). FCERI is found exclusively on mast cells,
receptor for IgE (FCERI). FCERI is found exclusively on mast cells,
basophils and related cells. Aggregation of IgE occupied FCERI by antig
triggers both the release of of preformed mediators such as histamine a
serotonin, as well as stimulating the synthesis of leukotrienes. It is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Alpha subunit of human high affinity receptor for IgE alpha subunit; human high affinity receptor; IgE; FCER, preformed mediator; histamine; serotonin; leukotriene; allergic condition; therapy; allergic response; drug so DNA probe; diagnostic assay; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequence differs slightly from that of CP2 and from clone CP2-PCR: (T45042) obtd. by PCR amplification of ATCC 43501 DNA. Isolation of CP2 genes allows the mass prodn. of CP2 protein in transformed host cells for use in vaccines. The genes can also be used to design primers (see also T45044-47) useful in the specific detection of H. pylori.

The Helicobacter pylori catalase gene encodes a protein of 58650 Da. The protein, gene sequence and products, such as an immunogenic fragmer can be used for the treatment or prevention of Helicobacter infection, particularly H. pylori infections which cause gastroduodenal disease. They can also be used for the detection and diagnosis of Helicobacter
               New isolated Helicobacter catalase nucleic acid - used to develop products for the treatment or prevention of Helicobacter infection, particularly H. pylori gastroduodenal disease Claim 29; Page 31-33; 46pp; English.

The Helicobacter pylori catalase gene encodes a protein of 58650 Da.

The protein, gene sequence and products, such as an immunogenic fragment, can be used for the treatment or prevention of Helicobacter infection,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                          New fusion polypeptide for, e.g. diagnosing allergies - comprises immunoglobulin E-binding domain fused to human serum albumin Disclosure; Page 56; 77pp; English.

C fils nucleotide sequence codes the dominant form of full-length native human IgE receptor Fc-epsilon RI alpha chain (see W48094).

A claimed fusion protein (FP) comprises an IgE binding domain fused to at least one human serum albumin (HSA) component (see W38095).

C (see W48096) comprising HSA fused, at each of its N- and C-termini, to the extracellular domain (i.e. mature protein) of Fc-epsilon RI to the extracellular domain (i.e. mature protein) of Fc-epsilon RI alpha chain. Also claimed are: nucleic acids encoding the FP; a vector; a process for preparing the FP; a method of performing gene therapy in humans that comprises removing somatic cells from a polynucleotide that encodes the FP, and reintroducing the modified cells into the patient; so that the FP is expressed by the cells of the patient; and use of the FP in an in vitro diagnostic assay to determine the level of IgE or auto-antibodies to Fc epsilon RI in a sample. The products can be used in the heavent on Education RI in a

                                                                                                                   sample. The products can be used in the prevention and/or treatment of IgE-mediated allergic diseases and related disorders such as atopic dermatitis, atopic asthma, chronic urticaria, hayfever and eczema. Compared with using IgE binding domain alone, the FP has a longer serum life, and thus greater activity, without a loss of ability to bind serum IgE or circulating auto-antibodies. Claim 11: Pages 36-37; 70pp; English.
The present sequence encodes the alpha chain of the human Fc epsilon receptor. Detection of canine, equine or feline immunoglobulin E (IgE) comprises reacting isolated human Fc epsilon receptor with the test sample and detecting formation of a IgE-receptor complex. Detection of IgE seceptor internal parasitic infections or B cell neoplasia, and for measuring effect of treatments. Most particularly flea allergy in dogs and cats is detected, and also heartworm infection.
